

TEST 1

Your Name (please PRINT): Caleb McWhorter
Student ID Number: _____

INSTRUCTIONS

- Fill in the above items.
- There is a total of 5 problems, for a maximum possible total value of 100 points. **Make sure you have all 6 test pages (this cover page + 5 test pages).** You are responsible to check that your test booklet has all 6 pages. Alert a proctor if your copy is missing any pages.
- **Show all your work.** Only minimal credit will be given for answers without supporting work.
- **Write your answer in the box at the bottom of pages 2-6.**
- **Use the back of test pages if additional space is needed,** and for scratch paper.
- **No calculators or other electronic devices; no outside notes; no outside tables** are allowed on this exam. Any use of calculators or electronic devices, or outside notes is a violation of the Academic Integrity Policy.

Do not write below this line

Pb. #	Max Points	Your Score
1	24	
2	14	
3	24	
4	20	
5	18	
Total	100	

1. (24 pts) Consider the two vectors

$$\mathbf{a} = \langle 1, -1, 2 \rangle, \quad \text{and} \quad \mathbf{b} = \langle -1, -1, 4 \rangle.$$

(a) Find the angle between \mathbf{a} and \mathbf{b} .

$$\begin{aligned} \vec{a} \cdot \vec{b} &= 1(-1) + (-1)(-1) + 2(4) \\ &= -1 + 1 + 8 = 8 \end{aligned}$$

$$\begin{aligned} |\vec{a}| &= \sqrt{1^2 + 1^2 + 2^2} = \sqrt{1+1+4} = \sqrt{6} \\ |\vec{b}| &= \sqrt{1^2 + 1^2 + 4^2} = \sqrt{1+1+16} = \sqrt{18} \end{aligned}$$

$$\begin{aligned} \vec{a} \cdot \vec{b} &= |\vec{a}| |\vec{b}| \cos \theta \\ 8 &= \sqrt{6} \sqrt{18} \cos \theta \end{aligned}$$

$$8 = 6\sqrt{3} \cos \theta$$

$$\cos \theta = \frac{4}{3\sqrt{3}}$$

$$\theta = \cos^{-1} \left(\frac{4}{3\sqrt{3}} \right)$$

(b) Find a vector that is perpendicular to both \mathbf{a} and \mathbf{b} .

$$\vec{a} \times \vec{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -1 & 2 \\ -1 & -1 & 4 \end{vmatrix}$$

$$= \hat{i}(-4 - 2) - \hat{j}(4 - 2) + \hat{k}(-1 - 1)$$

$$= -2\hat{i} - 6\hat{j} - 2\hat{k}$$

$$= \langle -2, -6, -2 \rangle \text{ or } \langle 2, 6, 2 \rangle \text{ or } \boxed{\langle 1, 3, 1 \rangle}$$

$$\text{or } \cos^{-1} \left(\frac{4}{\sqrt{27}} \right)$$

(c) Find the area of the parallelogram determined by \mathbf{a} and \mathbf{b} .

$$\begin{aligned} A &= |\vec{a} \times \vec{b}| = |\langle -2, -6, -2 \rangle| \\ &= \sqrt{2^2 + 6^2 + 2^2} \\ &= \sqrt{4 + 36 + 4} \\ &= \sqrt{44} \\ &= 2\sqrt{11} \end{aligned}$$

Answer for part (a):	$\cos^{-1} \left(\frac{4}{3\sqrt{3}} \right)$
Answer for part (b):	$\langle -2, -6, -2 \rangle$
Answer for part (c):	$\sqrt{44}$

2. (14 pts) Find the scalar equation of the plane that goes through the point $(-1, 2, -2)$ and is parallel to the plane with equation $2x - y + 3z = \sqrt{6}$.

To be \parallel to the given plane, our plane must have \parallel normal. So $\langle 2, -1, 3 \rangle$ will work.

$$\langle 2, -1, 3 \rangle \cdot \langle x - (-1), y - 2, z - (-2) \rangle = 0$$

$$2(x+1) - (y-2) + 3(z+2) = 0$$

$$2x - y + 3z + 2 + 2 + 6 = 0$$

$$2x - y + 3z = -10$$

Answer:

$$2x - y + 3z = -10$$

3. (24 pts) The points P_1 , P_2 , P_3 and P_4 are given by the x , y , z coordinates $(1, 0, 0)$, $(0, 0, 1)$, $(0, 2, 0)$ and $(2, 0, 2)$ respectively.

P_1 P_2 P_3

(a) Write parametric equations of the line L_1 connecting P_1 and P_2 .

$$\vec{P_1 P_2} = \langle 1-0, 0-0, 0-1 \rangle = \langle 1, 0, -1 \rangle$$

$$\begin{aligned} \Gamma(t) &= \langle 1, 0, -1 \rangle t + \langle 1, 0, 0 \rangle \\ &= \langle t+1, 0, -t \rangle \end{aligned} \quad \begin{cases} x = t+1 \\ y = 0 \\ z = -t \end{cases}$$

(b) Write parametric equations of the line L_2 connecting P_3 and P_4 .

$$\vec{P_3 P_4} = \langle 0-2, 2-0, 0-2 \rangle = \langle -2, 2, -2 \rangle \text{ or } \langle 2, -2, 2 \rangle \text{ or } \langle 1, -1, 1 \rangle$$

$$\begin{aligned} \Gamma(t) &= \langle 1, -1, 1 \rangle t + \langle 0, 2, 0 \rangle \\ &= \langle t, 2-t, t \rangle \end{aligned} \quad \begin{cases} x = t \\ y = 2-t \\ z = t \end{cases}$$

(c) Determine whether L_1 and L_2 intersect, are parallel or skew and explain why.

$\langle 1, 0, -1 \rangle \neq \langle 1, -1, 1 \rangle$ so they are not parallel.

If they intersect

$$\begin{aligned} t+1 &= s \\ 0 &= 2-s \\ -t &= s \end{aligned} \rightarrow \begin{aligned} s &= 2 \\ \text{so } t &= -2 \end{aligned}$$

$\begin{aligned} t+1 &\stackrel{?}{=} s \\ -2+1 &\stackrel{?}{=} 2 \\ -1 &\neq 2 \end{aligned}$ } So they do not intersect.
Then these lines are skew.

Answer for part (a):	$x = t+1; y = 0; z = -t$
Answer for part (b):	$x = t; y = 2-t; z = t$
Answer for part (c):	Skew

4. (20 pts) A curve is given by the following parametric equation:

$$\vec{r}(t) = 2\cos(2t)\hat{i} + 2\sin(2t)\hat{j} + 3t\hat{k}$$

(a) Find its unit tangent vector $\hat{T}(t)$.

$$\vec{r}(t) = \langle 2\cos 2t, 2\sin 2t, 3t \rangle$$

$$\vec{r}'(t) = \langle -4\sin 2t, 4\cos 2t, 3 \rangle$$

$$\begin{aligned} |\vec{r}'(t)| &= \sqrt{(-4\sin 2t)^2 + (4\cos 2t)^2 + 3^2} \\ &= \sqrt{16\sin^2 2t + 16\cos^2 2t + 9} \\ &= \sqrt{16 + 9} \\ &= \sqrt{25} \\ &= 5 \end{aligned}$$

$$\begin{aligned} \int_0 \hat{T}_u(t) &= \frac{\vec{r}'(t)}{|\vec{r}'(t)|} \\ &= \frac{\vec{r}'(t)}{5} \end{aligned}$$

$$= \left\langle \frac{-4\sin 2t}{5}, \frac{4\cos 2t}{5}, \frac{3}{5} \right\rangle$$

(b) Find its principal unit normal vector $\hat{N}(t)$.

$$\vec{T}(t) = \langle -4\sin 2t, 4\cos 2t, 3 \rangle$$

$$\vec{T}'(t) = \langle -8\cos 2t, -8\sin 2t, 0 \rangle$$

$$\begin{aligned} |\vec{T}'(t)| &= \sqrt{(-8\cos 2t)^2 + (-8\sin 2t)^2 + 0^2} \\ &= \sqrt{64\cos^2 2t + 64\sin^2 2t} \\ &= \sqrt{64} \\ &= 8 \end{aligned}$$

$$\hat{N}_u(t) = \frac{\vec{T}'(t)}{|\vec{T}'(t)|}$$

$$= \langle -\cos 2t, -\sin 2t, 0 \rangle$$

Answer for part (a):

$$\left\langle \frac{-4\sin 2t}{5}, \frac{4\cos 2t}{5}, \frac{3}{5} \right\rangle$$

Answer for part (b):

$$\langle -\cos 2t, -\sin 2t, 0 \rangle$$

5. (18 pts) Match the following functions with the given graphs and explain why.

$$(1) x^2 + \frac{y^2}{9} + \frac{z^2}{16} = 1$$

$$(2) z = 4x^2 + 9y^2$$

$$(3) x = z^2 + 1$$

(1) Notice for any fixed value of x, y, z not sufficiently large, we obtain an ellipse. So level curves in each of the $\hat{x}, \hat{y}, \hat{z}$ directions must be elliptical. Therefore, this must be (b).

(2) For fixed values of z , we obtain an ellipse. The larger the chosen z , the larger the ellipse. Therefore, this must be (c).

(3) For any y , we see a parabola in the xz -plane. Therefore, this must be (a).
