

Name: _____
MAT 296

Quiz 11: Series Tests
Fall 2017

Problem 1: Determine whether the following series converges or diverges. Be sure you prove your answer.

$$\sum_{n=1}^{\infty} \sin\left(\frac{1}{n^2}\right)$$

Problem 2: Determine whether the following series converges or diverges. Be sure you prove your answer.

$$\sum_{n=1}^{\infty} \frac{2n+1}{n^2+n-1}$$

Bonus: In the episode “Benderama” of the TV show Futurama™, the robot Bender avoids doing work by consuming some mass and making two smaller copies of himself, each 60% of his size, and makes the new copies do the work. Being equally lazy, the copies make copies of themselves to do their work and so forth. At one point in the episode, Professor Farnsworth runs into the room and announces that if this keeps up the total mass of Benders in the world will be given by

$$M = \sum_{n=0}^{\infty} 2^n \cdot \left[\frac{M_0}{2^n(n+1)} \right]$$

where M is the total mass of the Benders and M_0 is just some constant representing whatever the *original* Bender weighed. Everyone gasps in horror (except for Fry who does not understand). Explain why everyone is so worried. [Fun Fact: One of the creators/writers of the show has a PhD. in Math, which is why there are so many Math/Science jokes/references throughout the show. Fun Fact 2: The equation Professor Farnsworth gives and what he says are incorrect. *J'accuse!*]
